Total DP Goals + Assists

791

541 goals, 250 assists

Salary vs. Goals + Assists Contributions

Higher spending does not always lead to higher goal output

All Performance

2025

Performance Measurement: Player performance is evaluated by comparing actual G+A contributions against expected contributions based on salary. Players who exceed expectations significantly are **Overperformed**, those who fall short are **Underperformed**, and those within range are **On Curve**.

69 Players

Player	Team	Salary (\$M)	G+A	Cost/G+A
Martín Ojeda	ORL	\$1.03	25	\$41K
Joaquín Pereyra	MIN	\$0.84	13	\$65K
Anders Dreyer	SD	\$2.43	35	\$70K
Bruno Damiani	PHI	\$0.73	8	\$91K
Rafael Navarro	COL	\$1.45	15	\$97K
Marco Pašalić	ORL	\$1.65	16	\$103K
Petar Musa	FCD	\$2.68	24	\$112K

Key Insight:

There is a weak correlation between salary investment and goal output among Designated Players. Several high-earning players follow uniform output relative to their cost, while some lower-paid players deliver exceptional value with higher goal contributions per dollar spent.

Methodology Note:

These metrics favor attacking players (forwards and attacking midfielders) as they focus on goals and assists. However, most clubs strategically allocate their Designated Player spots to these positions, making this analysis particularly relevant for evaluating DP value and investment efficiency.

Player Cost per Goal + Assist Contribution vs. Guaranteed Compensation

Lower cost per G+A = more efficient use of DP salary

All Performance

This plot focuses on efficiency. Players are categorized based on whether their cost per contribution is below (more efficient), around (expected efficiency), or above (less efficient) a median or threshold value. This highlights players who provide their contributions at a lower cost, regardless of their total compensation, by normalizing their output against their salary.

Overperformed (Efficient) On Curve (Expected Cost) Underperformed (Inefficient) Regression line
